# Electronic Pharmacie lockers

24/7 availability of  
ordered medicines

Lockers for your pharmacie

## Collect medicines 24/7

With Olssen's advanced locker system, you as a pharmacist can offer a 24/7 service to your customers. The locker system can be integrated in all locker cabinets in our range. This way you can arrange your locker wall completely according to your wishes.

By realizing a software-based link with your online ERP system, the wrong issue of medicines is a thing of the past. Everything is automated so that as few human actions as possible are required.

Below you can read step by step how the locker system works:

If you, as a pharmacist, have packed the relevant prescription, it will be scanned with a barcode scanner at the locker wall. The locker system uses the link to know which customer is involved and which recipe is in the locker.

The locker system assigns the order to a free locker. The locker opens and the employee puts the medicines in the opened locker.

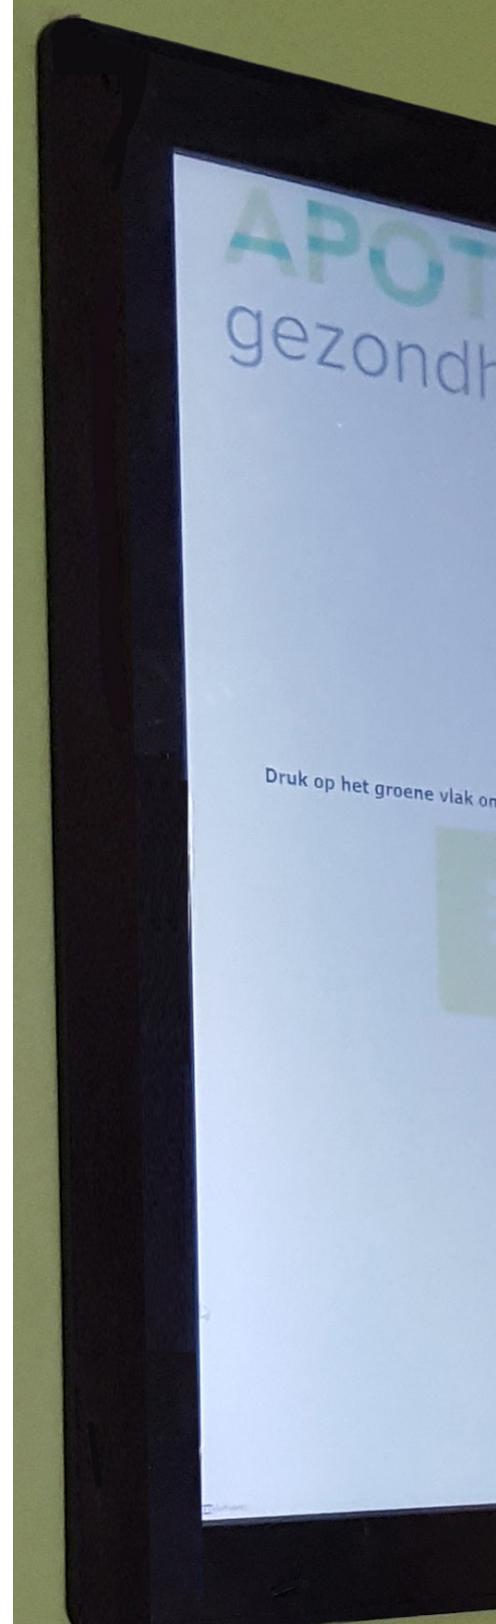

A message is sent from the locker system to the customer. This can be done via email or text message. The message will include a QR code or pin code with which the customer can open the locker. Depending on the settings, we also send where the customer can get the medicines.

The pharmacist can set a time period for each order separately in which the customer has to collect the prescription. Think, for example, of a maximum of 24 hours. This so that the lockers do not remain full with orders that are not picked up.

If the customer does not collect the order within the time period, the administrator and the customer will be notified that the order has not yet been collected.

When the order is collected by the customer, the locker is released for a new order. By dynamically assigning the lockers, each locker is assigned equally often so that all lockers are used.

If the lockers are in an enclosed space, such as an access lock or a separate room in a building, a software-based link can be realized with the access doors. This allows the customer to open the entrance door using the same QR code or PIN.

## Serve your customers 24/7

With the Olssen electronic locker system you can offer your customers a 24/7 service. Partly because of the automation within your organization together with the lockers, we offer you a future-proof locker system. Your customers can also open your front door with the same code to open the locker. In addition, the user can choose to pay for the order online or at the locker wall using a certified pin terminal.

## High-tech lockers in the look you want

In addition to our advanced locker system, we have a wide range of locker cabinets in which the locker system can be implemented. Due to the many choices in dimensions, materials and colors, the pharmacy lockers can be produced entirely according to your wishes. The lockers can also be made in an antibacterial version to hand over the products to the customer as hygienically as possible. It is also possible to use cooled lockers.

Can be linked to pharmacy tracking systems.

Increases service to your customers.

Payment platform for online payments.

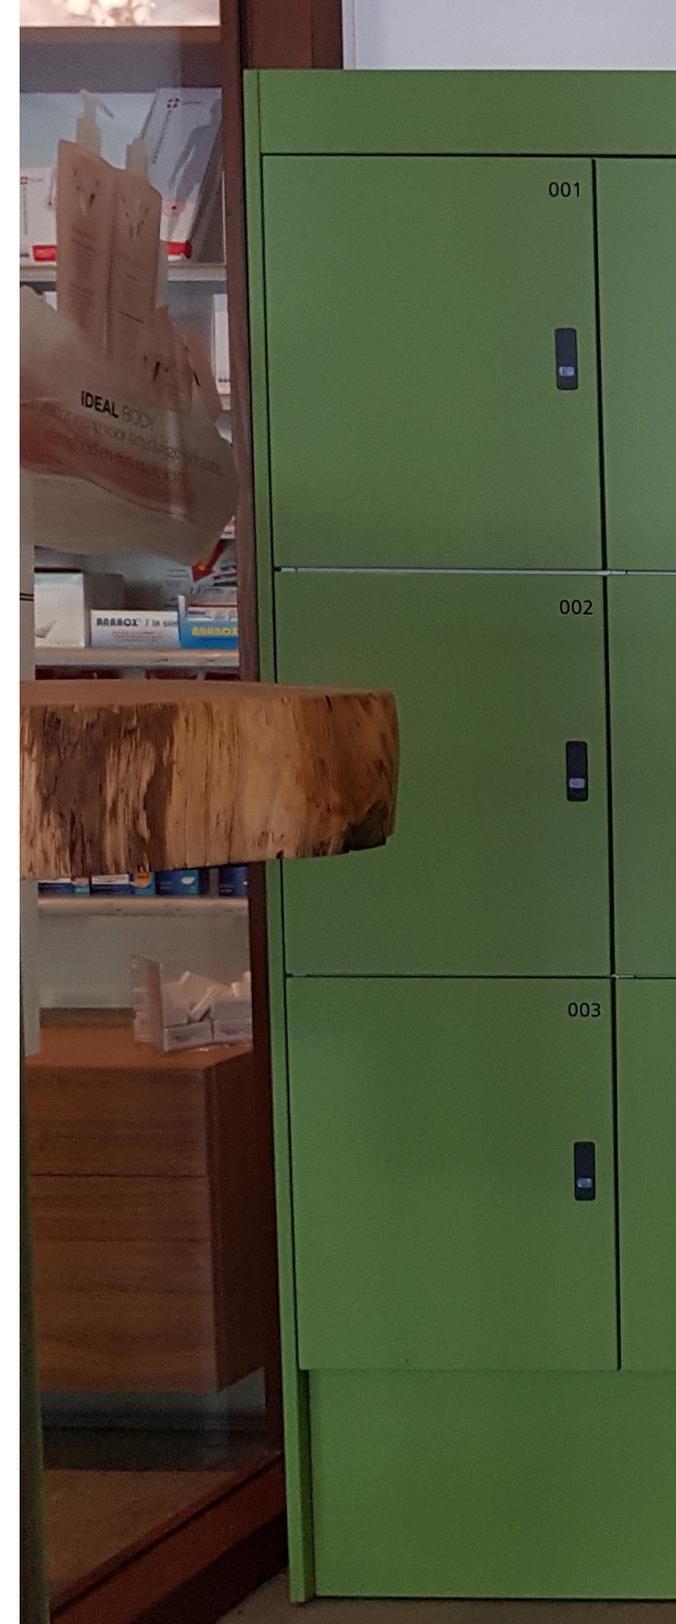

Prevents mistakes when dispensing medicines.

## VVVV

The locker system for pharmacies has been developed in close collaboration with the pharmacy. This system consists of a varied locker range, with intelligent locks and advanced software. The system is placed in the entrance of the health house.

The moment a pharmacist's assistant has medicines ready for collection, the barcode of the prescription is scanned. Then, depending on the format of the medication, the appropriate box is chosen. As soon as the box is closed, the link between the Locker Management System and the Pharmacy Information System ensures that a collection message is sent via email and / or SMS. The pick-up message contains the code for the operation of the locker and the entrance door. This code also temporarily disables the alarm. This means 24/7 accessibility.
